3.6 Java geometry

```
// In this example, we read an input file containing three lines, each
// containing an even number of doubles, separated by commas.  The
   first two
// lines represent the coordinates of two polygons, given in
   counterclockwise
// (or clockwise) order, which we will call "A" and "B".  The last
   line
// contains a list of points, p[1], p[2], ...
//
// Our goal is to determine:
//   (1) whether B - A is a single closed shape (as opposed to
   multiple shapes)
//   (2) the area of B - A
//   (3) whether each p[i] is in the interior of B - A
//
// INPUT:
//   0 0 10 0 0 10
//   0 0 10 10 10 0
//   8 6
//   5 1
//
// OUTPUT:
//   The area is singular.
//   The area is 25.0
//   Point belongs to the area.
//   Point does not belong to the area.

5.6 Kruskal's algorithm

```
/*
Uses Kruskal's Algorithm to calculate the weight of the minimum
    spanning
forest (union of minimum spanning trees of each connected component)
    of
a possibly disjoint graph, given in the form of a matrix of edge
    weights
(-1 if no edge exists). Returns the weight of the minimum spanning
forest (also calculates the actual edges - stored in T). Note: uses a
disjoint-set data structure with amortized (effectively) constant time
     per
union/find. Runs in O(E*log(E)) time.
*/

#include <iostream>

```

8 Formating, STL

8.1 C++ input/output

```
#include <iostream>
#include <iomanip>

using namespace std;

int main()
{
    // Ouput a specific number of digits past the decimal point,
    // in this case 5
    cout.setf(ios::fixed); cout << setprecision(5);
    cout << 100.0/7.0 << endl;
    cout.unsetf(ios::fixed);

    // Output the decimal point and trailing zeros
    cout.setf(ios::showpoint);
    cout << 100.0 << endl;
    cout.unsetf(ios::showpoint);

    // Output a '+' before positive values
    cout.setf(ios::showpos);
    cout << 100 << " " << -100 << endl;
    cout.unsetf(ios::showpos);

    // Output numerical values in hexadecimal
    cout << hex << 100 << " " << 1000 << " " << 10000 << dec << endl;
}
```

8.2 STL next permutation

```
// Example for using stringstreams and next_permutation

#include <algorithm>
#include <iostream>
#include <sstream>
#include <vector>

using namespace std;

int main(void){
  vector<int> v;

  v.push_back(1);
  v.push_back(2);
  v.push_back(3);
  v.push_back(4);

  // Expected output: 1 2 3 4
  //                  1 2 4 3
  //                  ...
  //                  4 3 2 1
  do {
    ostringstream oss;
    oss << v[0] << " " << v[1] << " " << v[2] << " " << v[3];

    // for input from a string s,
    //   istringstream iss(s);
    //   iss >> variable;

    cout << oss.str() << endl;
  } while (next_permutation (v.begin(), v.end()));

  v.clear();

  v.push_back(1);
  v.push_back(2);
  v.push_back(1);
  v.push_back(3);

  // To use unique, first sort numbers.  Then call
  // unique to place all the unique elements at the beginning
  // of the vector, and then use erase to remove the duplicate
  // elements.

  sort(v.begin(), v.end());
  v.erase(unique(v.begin(), v.end()), v.end());

  // Expected output: 1 2 3
  for (size_t i = 0; i < v.size(); i++)
    cout << v[i] << " ";
  cout << endl;
}
```

8.3 Dates

```
// Routines for performing computations on dates.  In these routines,
// months are expressed as integers from 1 to 12, days are expressed
// as integers from 1 to 31, and years are expressed as 4-digit
// integers.

#include <iostream>
#include <string>

using namespace std;

string dayOfWeek[] = {"Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun"
    };

// converts Gregorian date to integer (Julian day number)
int dateToInt (int m, int d, int y){
  return
    1461 * (y + 4800 + (m - 14) / 12) / 4 +
    367 * (m - 2 - (m - 14) / 12 * 12) / 12 -
    3 * ((y + 4900 + (m - 14) / 12) / 100) / 4 +
    d - 32075;
}

// converts integer (Julian day number) to Gregorian date: month/day/
    year
void intToDate (int jd, int &m, int &d, int &y){
  int x, n, i, j;

  x = jd + 68569;
  n = 4 * x / 146097;
  x -= (146097 * n + 3) / 4;
  i = (4000 * (x + 1)) / 1461001;
  x -= 1461 * i / 4 - 31;
  j = 80 * x / 2447;
  d = x - 2447 * j / 80;
  x = j / 11;
  m = j + 2 - 12 * x;
  y = 100 * (n - 49) + i + x;
}

// converts integer (Julian day number) to day of week
string intToDay (int jd){
  return dayOfWeek[jd % 7];
}

int main (int argc, char **argv){
  int jd = dateToInt (3, 24, 2004);
  int m, d, y;
  intToDate (jd, m, d, y);
  string day = intToDay (jd);
```

```
    // expected output:
    //    2453089
    //    3/24/2004
    //    Wed
    cout << jd << endl
      << m << "/" << d << "/" << y << endl
      << day << endl;
}
```

8.4 Dates (Java)

```
// Example of using Java's built-in date calculation routines

import java.text.SimpleDateFormat;
import java.util.*;

public class Dates {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        SimpleDateFormat sdf = new SimpleDateFormat("M/d/yyyy");
        while (true) {
            int n = s.nextInt();
            if (n == 0) break;
            GregorianCalendar c = new GregorianCalendar(n, Calendar.
                JANUARY, 1);
            while (c.get(Calendar.DAY_OF_WEEK) != Calendar.SATURDAY)
                c.add(Calendar.DAY_OF_YEAR, 1);
            for (int i = 0; i < 12; i++) {
                System.out.println(sdf.format(c.getTime()));
                while (c.get(Calendar.MONTH) == i) c.add(Calendar.
                    DAY_OF_YEAR, 7);
            }
        }
    }
}
```

8.5 Decimal output formatting (Java)

```
// examples for printing floating point numbers

import java.util.*;
import java.io.*;
import java.text.DecimalFormat;

public class DecFormat {
    public static void main(String[] args) {
        DecimalFormat fmt;

        // round to at most 2 digits, leave of digits if not needed
        fmt = new DecimalFormat("#.##");
        System.out.println(fmt.format(12345.6789)); // produces
            12345.68
        System.out.println(fmt.format(12345.0)); // produces 12345
        System.out.println(fmt.format(0.0)); // produces 0
        System.out.println(fmt.format(0.01)); // produces .1

        // round to precisely 2 digits
        fmt = new DecimalFormat("#.00");
        System.out.println(fmt.format(12345.6789)); // produces
            12345.68
        System.out.println(fmt.format(12345.0)); // produces 12345.00
        System.out.println(fmt.format(0.0)); // produces .00

        // round to precisely 2 digits, force leading zero
        fmt = new DecimalFormat("0.00");
        System.out.println(fmt.format(12345.6789)); // produces
            12345.68
        System.out.println(fmt.format(12345.0)); // produces 12345.00
        System.out.println(fmt.format(0.0)); // produces 0.00

        // round to precisely 2 digits, force leading zeros
        fmt = new DecimalFormat("000000000.00");
        System.out.println(fmt.format(12345.6789)); // produces
            000012345.68
        System.out.println(fmt.format(12345.0)); // produces
            000012345.00
        System.out.println(fmt.format(0.0)); // produces 000000000.00

        // force leading '+'
        fmt = new DecimalFormat("+0;-0");
        System.out.println(fmt.format(12345.6789)); // produces +12346
        System.out.println(fmt.format(-12345.6789)); // produces
            -12346
        System.out.println(fmt.format(0)); // produces +0

        // force leading positive/negative, pad to 2
        fmt = new DecimalFormat("positive 00;negative 0");
        System.out.println(fmt.format(1)); // produces "positive 01"
        System.out.println(fmt.format(-1)); // produces "negative 01"

        // qoute special chars (#)
        fmt = new DecimalFormat("text with '#' followed by #");
        System.out.println(fmt.format(12.34)); // produces "text with
            # followed by 12"

        // always show "."
        fmt = new DecimalFormat("#.#");
        fmt.setDecimalSeparatorAlwaysShown(true);
        System.out.println(fmt.format(12.34)); // produces "12.3"
        System.out.println(fmt.format(12)); // produces "12."
        System.out.println(fmt.format(0.34)); // produces "0.3"

        // different grouping distances:
        fmt = new DecimalFormat("#,####.###");
        System.out.println(fmt.format(123456789.123)); // produces
            "1,2345,6789.123"

        // scientific:
        fmt = new DecimalFormat("0.000E00");
        System.out.println(fmt.format(123456789.123)); // produces
            "1.235E08"
        System.out.println(fmt.format(-0.000234)); // produces "-2.34E
            -04"

        // using variable number of digits:
        fmt = new DecimalFormat("0");
        System.out.println(fmt.format(123.123)); // produces "123"
        fmt.setMinimumFractionDigits(8);
        System.out.println(fmt.format(123.123)); // produces
            "123.12300000"
        fmt.setMaximumFractionDigits(0);
        System.out.println(fmt.format(123.123)); // produces "123"

        // note: to pad with spaces, you need to do it yourself:
        // String out = fmt.format(...)
        // while (out.length() < targlength) out = " "+out;
    }
}
```

8.6 Regular expressions

```
// Code which demonstrates the use of Java's regular expression
    libraries.
// This is a solution for
```

```
//
//   Loglan: a logical language
//   http://acm.uva.es/p/v1/134.html
//
// In this problem, we are given a regular language, whose rules can
    be
// inferred directly from the code.  For each sentence in the input,
    we must
// determine whether the sentence matches the regular expression or
    not.  The
// code consists of (1) building the regular expression (which is
    fairly
// complex) and (2) using the regex to match sentences.

import java.util.*;
import java.util.regex.*;

public class LogLan {

    public static String BuildRegex (){
        String space = " +";

        String A = "([aeiou])";
        String C = "([a-z&&[^aeiou]])";
        String MOD = "(g" + A + ")";
        String BA = "(b" + A + ")";
        String DA = "(d" + A + ")";
        String LA = "(l" + A + ")";
        String NAM = "([a-z]*" + C + ")";
        String PREDA = "(" + C + C + A + C + A + "|" + C + A + C + C +
             A + ")";

        String predstring = "(" + PREDA + "(" + space + PREDA + ")*)";
        String predname = "(" + LA + space + predstring + "|" + NAM +
            ")";
        String preds = "(" + predstring + "(" + space + A + space +
            predstring + ")*)";
        String predclaim = "(" + predname + space + BA + space + preds
             + "|" + DA + space +
            preds + ")";
        String verbpred = "(" + MOD + space + predstring + ")";
        String statement = "(" + predname + space + verbpred + space +
             predname + "|" +
            predname + space + verbpred + ")";
        String sentence = "(" + statement + "|" + predclaim + ")";

        return "^" + sentence + "$";
    }

    public static void main (String args[]){

        String regex = BuildRegex();
        Pattern pattern = Pattern.compile (regex);

        Scanner s = new Scanner(System.in);
        while (true) {

            // In this problem, each sentence consists of multiple
                lines, where the last
            // line is terminated by a period.  The code below reads
                lines until
            // encountering a line whose final character is a '.'.
                Note the use of
            //
            //    s.length() to get length of string
            //    s.charAt() to extract characters from a Java string
            //    s.trim() to remove whitespace from the beginning and
                 end of Java string
            //
            // Other useful String manipulation methods include
            //
            //    s.compareTo(t) < 0 if s < t, lexicographically
            //    s.indexOf("apple") returns index of first occurrence
                 of "apple" in s
            //    s.lastIndexOf("apple") returns index of last
                occurrence of "apple" in s
            //    s.replace(c,d) replaces occurrences of character c
                with d
            //    s.startsWith("apple) returns (s.indexOf("apple") ==
                0)
            //    s.toLowerCase() / s.toUpperCase() returns a new
                lower/uppercased string
            //
            //    Integer.parseInt(s) converts s to an integer (32-bit
                )
            //    Long.parseLong(s) converts s to a long (64-bit)
            //    Double.parseDouble(s) converts s to a double

            String sentence = "";
            while (true){
                sentence = (sentence + " " + s.nextLine()).trim();
                if (sentence.equals("#")) return;
                if (sentence.charAt(sentence.length()-1) == '.') break
                    ;
            }

            // now, we remove the period, and match the regular
                expression

            String removed_period = sentence.substring(0, sentence.
                length()-1).trim();
            if (pattern.matcher (removed_period).find()){
                System.out.println ("Good");
            } else {
                System.out.println ("Bad!");
            }
        }
    }
}
```

9 Classical Problems

9.1 Illumination(Tarjan 2SAT)

```
/*
 tarjan + 2sat
You inherited a haunted house. Its floor plan is an n-by-n square grid
     with l lamps in fixed
locations and no interior walls. Each lamp can either illuminate its
    row or its column, but not both
simultaneously. The illumination of each lamp extends by r squares in
    both directions, so a lamp
unobstructed by an exterior wall of the house can illuminate as many
    as 2r + 1 squares.

n, r and l (1 < n, r, l < 1,000).
ri and ci (1 < ri, ci < n), indicating that there is a lamp in row ri
    and column ci.

YES if it is possible to illuminate all lamps as stated above
*/
